

C3-094A GridOps Incident Gate A

Protected independent C3-08 production-safety assessment

2026 LEARNER EDITION

Option B institute family: Charcoal #1F2937 | Teal #14B8A6 | Soft Blue #3B82F6 | AMOLED-ready companion shell.

Closed-book boundary

Lesson Book, Practice Review, Mini-Lab review, AI solving and tutorial/web solution search are closed. Use the supplied synthetic case and explicitly permitted syntax references only.

Scenario

GridOps energy readings contain a silent numeric corruption after a recent transformation release. Operate from detection through safe recovery and prevention.

Required competencies

C1 Contract/grain/key + critical quality checks. C2 Source-target reconciliation and exact defect. C3 Severity/publish decision + consumer impact. C4 Correlated logs/metrics/SLI/SLO/alert evidence. C5 Incident timeline/containment/RCA. C6 Bounded repair/reprocess + post-recovery reconciliation. C7 Preventive tests + CI/release gate. C8 Promotion/protection + secret/IAM boundary. C9 Privacy/encryption/sanitized evidence. C10 Runbook/ownership/handoff. C11 IaC plan/state/drift reasoning. C12 Cost/performance/reliability trade-off.

PASS rule

C1-C12 must each PASS, and unresolved critical failures must be zero. There is no percentage, average, points or weighted-score shortcut.

Critical failures

Fabricated evidence; secret/PII exposure; publishing known corrupt data; destructive/unbounded recovery; wrong grain/key that invalidates reconciliation; skipping post-repair proof; bypassing protected assessment routing; overwriting prior attempt.

Operational proof

Detect -> contain -> diagnose -> repair -> reprocess -> reconcile -> prevent. Save evidence for each transition.

Submission bundle

Incident timeline + reconciliation before/after + sanitized telemetry + quality/severity decision + prevention tests/CI + access/release/laC notes + runbook + teach-back.
